EXECUTIVE SUMMARY

Retail Trade Analysis for Winona, MN

LEVEL SALES IN MOST RETAIL SECTORS

The Minnesota Department of Revenue releases sales tax information each spring for the year that ended about 15 months earlier. The latest information indicates that Winona’s taxable retail and service sales increased over 8.7% between 2010 and 2013, reaching an estimated total of \$278 million.

The largest increase in dollar sales was in the business category of eating and drinking, reaching estimated total sales of \$67 million in 2013. General Merchandise stores are the largest contributors of taxable sales in Winona’s economy, with 27 % of all taxable sales. Note: The data in this summary are not adjusted for inflation.

Total taxable sales only had minor changes between 2012 and 2013. When the taxable sales are adjusted for inflation, there was the slightest (< 1%) decline from a strong 2012.

Comparisons with Other Area Cities

There are several ways to measure performance other than dollars of sales. Economists expect cities of larger populations to have more sales since their potential customer base is larger. A way to compensate for that in a retail trade analysis is to measure the *pull factor*, which compares the local taxable sales per capita to that of the state. A pull factor index higher than 1.00 often indicates that businesses are pulling in customers from outside their community. A lower pull factor usually indicates residents are leaving the community to make purchases. Winona reached its highest pull factor for many years in 2013. Per capita taxable sales in 2013 were estimated to be \$10,035 locally and \$8,617 for Minnesota for a pull factor of 1.16.

Taxable Sales Changes by Category (in Millions) 2010 to 2013

Pull Factors

Comparing Winona's Performance to Similar Minnesota Cities

The following tables provide information on retail sales by selected merchandise categories. "Expected sales" is a standard to which actual performance can be compared. In calculating expected sales, population, income, and typical "pulling power" characteristics are taken into account. The following table calculates pulling power using a similar non-metro city list based on population + or - 30% of Winona's so it includes Owatonna, Austin, Faribault, Elk River, and Willmar. Expected sales can be used as a guideline or "par value" in analyzing retail strength.

Selected Categories	Expected Sales (millions)	Actual Sales (millions)	Variance As % of Expected	Trade Area's Estimated Customer Gain (or Loss)
Building Materials	\$32.09	\$37.17	+15.8%	+ 4,389
Food, Groceries	\$16.55	\$17.46	+5.5%	+1,532
General Merchandise	\$44.58	\$76.37	+71.3%	+ 19,785
Eating & Drinking Places	\$31.81	\$67.56	+112.4%	+ 31,185
Total Taxable Retail & Service	\$202.38	\$278.39	+37.6%	+ 10,419

THE BOTTOM LINE

The taxable sales in the City of Winona have been relatively steady over the past few years at a level that indicates businesses are attracting customers. There are some retail gaps that should be analyzed further for possible business expansion. Both the county and city trade area analyses indicate possible opportunities in furniture, leisure goods, and clothing stores. A focused local survey might reveal how local businesses can better fill this market.

Winona was part of a 2014 research study on stores compatible with Walmart Supercenters. <http://z.umn.edu/walmart>. This may reveal ideas for local entrepreneurs.

The full retail trade analysis report will show how various retail categories have changed since 2003 so individual businesses can see how they performed compared to the whole community. The report is also useful for exploring expansion opportunities.

Winona Retail Trade Overview

Total Taxable and Gross Retail Sales

The table below presents gross and taxable retail and services sales for Winona from 1990 through 2013. Without inflation adjustments, taxable sales in Winona increased 18.4 percent from 2006 to 2013, while the number of firms fell 8.8 percent. Statewide, taxable sales increased 8.7 percent over the same time period and the number of firms grew 1.4 percent. The per capita sales and pull factor data in this table are based on taxable sales, the more verified sales measure.

The table also presents sales data in constant 2013 dollars. These figures have been adjusted for inflation to reflect their value in 2013. For example, in 1990, taxable sales in Winona totaled \$124.05 million, an amount worth \$221.52 million in 2013 dollars. In constant dollars, gross sales fell 1.7 percent between 2006 and 2013. Constant dollar taxable sales increased 1.8 percent over the same time period.

Year	Estimated Population	Current Dollars		Constant 2013 Dollars		Number of Firms	Per Capita Sales	Pull Factor

*Caution should be used when comparing pull factors before 2003 to those in later years due to how businesses are classified.

Comparison with Competing Centers

Winona

□ Winona
× Red Wing

▲ Owatonna
◆ Rochester

Information about competing trade centers can provide a useful means of comparison when assessing a community's retail trade sector. Comparison towns were selected based on geographic proximity, relative size and availability of data. Some caution is warranted in the interpretation of these comparisons however, since retail sales data is provided for only a limited number of towns and cities.

Comparison with Competing Trade Centers, 2013

Town	Population	Gross Sales (\$millions)	Taxable Sales (\$millions)	Number of Firms	Per Capita Taxable Sales	Pull Factor (Taxable Sales)
Winona	27,741	\$683.04	\$278.39	551	\$10,035	1.16
Owatonna	25,574	\$1,909.35	\$261.45	564	\$10,223	1.19
Red Wing	16,488	\$650.52	\$195.61	435	\$11,864	1.38
Rochester	110,393	\$3,240.87	\$1,382.16	2,192	\$12,520	1.45

Rural Community Trade Area Analysis

Winona

The following tables provide information on retail sales by merchandise category. "Expected sales" is a standard to which actual performance is compared. In calculating expected sales, population and income characteristics, as well as the typical "pulling power" of similar rural communities are taken into account. Expected sales can be used as a guideline or "par value" in analyzing retail strength.

Deviations from these norms can be analyzed to first judge whether they should be considered relevant. If the differences appear to be significant (whether in dollar amounts or relatively with percentages), additional consideration is merited. Categories with undesirable performance may be further examined for potential corrective action. It is also important to determine whether or not the situation is relatively uncontrollable due to external or extenuating circumstances. In cases of favorable differences from expectations, the positive aspects could be identified and built upon.

*All retail and service categories are included in Total Sales, including some categories not shown. Therefore, the merchandise groups shown here generally will not sum to Total Sales.

Summary of Winona Retail Trade (Rural)

The chart below depicts the percentage amount Winona's actual sales were above or below expected sales in 2013 by merchandise group. Of the 16 merchandise categories with reported data, sales in 9 of the categories were above what would be expected based on the performance in similar-sized cities in Greater Minnesota. The strongest merchandise group by this standard is the Eating & Drinking Places category, which has a 112.4 percent surplus. Overall, Winona had a retail sales surplus of 37.6 percent in 2013.

It is important to note that variations in a city's relative retail performance may occur for a variety of reasons, some of which are beyond the control of local policy. Proximity to larger population centers, management, marketing, and transportation patterns are just a few factors that can cause the retail sales of a particular city to deviate substantially from expected sales. It is important that decision-makers consider these influences when constructing policies, plans, or projects.

Percentage Above or Below Expected Sales, 2013

Winona Retail Trade Performance in Dollars (Rural)

The chart below depicts the dollar amount Winona's actual sales were above or below expected sales in 2013 by merchandise group. Of the 16 merchandise categories with reported data, sales in 9 of the categories were above what would be expected based on the performance in similar-sized Minnesota cities. The strongest merchandise group by this standard is the Eating & Drinking Places category, which has a \$35.8 million surplus. Overall, Winona had a retail sales surplus of \$76.0 million in 2013.

It is important to note that variations in a city's relative retail performance may occur for a variety of reasons, some of which are beyond the control of local policy. Proximity to larger population centers, management, marketing, and transportation patterns are just a few factors that can cause the retail sales of a particular city to deviate substantially from expected sales. It is important that decision-makers consider these influences when constructing policies, plans, or projects.

* Raw averages; not adjusted for special circumstances. For example, in cities with a college student population that is large relative to overall population, these pull factors may understate the relative strength of the retail sector. While college students are counted as part of the city population, in general they spend less than other city residents in many retail categories. Most Pull Factor outliers were eliminated for calculating typical pull factors used in the expected sales formula.

Winona & Winona County Comparison, 2013

It is important to review the retail performance for the whole county and not just the city in isolation. For example, it is common for county seat towns to have above-average retail performance, while the county overall has a leakage of sales. This is usually because the county seat city doesn't have the critical mass of retail to attract the purchases of everyone in the county. By analyzing county data, city business people can develop strategies to recapture some of the sales being lost to other cities. For counties that have a local option sales tax, the analysis of county sales is extremely important, since lost sales are lost tax dollars. A thorough analysis of county sales can help county officials develop more meaningful economic development plans aimed at recapturing the lost sales.

The table below shows retail sales and number of firms by merchandise category for Winona and Winona County in 2013. Winona accounted for 55 percent of the county's firms and 85 percent of the county's sales.

Sales by Merchandise Category, Winona & Winona County, 2013

Winona County Retail Trade Overview

Total Taxable and Gross Retail Sales

The table below presents gross and taxable retail and services sales for Winona County from 1990 through 2013. Taxable sales in Winona County increased 19.8 percent from 2006 to 2013, while the number of firms fell 4.9 percent. Statewide, taxable sales increased 8.7 percent over the same time period and the number of firms increased 1.4 percent. The per capita sales and pull factor data in this table are based on taxable sales, the more verified sales measure.

The table also presents sales data in constant 2013 dollars. These figures have been adjusted for inflation to reflect their value 2013. For example, in 1990, taxable sales in Winona County totaled \$145.36 million, an amount worth \$259.56 million in 2013 dollars. In constant dollars, gross sales grew 4.9 percent between 2006 and 2013. Constant dollar taxable sales increased 3 percent over the same time period.

Dollar Changes by Category (in Millions) 2010 - 2013

Pull Factors By Merchandise Category

Winona County

The following tables and charts depict pull factors in Winona County from 2003 to 2013* by merchandise category. Pull factors are a measure of trade area size that provide a useful measure of changes over time because they account for changes in population and state-wide industry trends.

Pull Factors by NAICS Merchandise Category (1 of 2)

NAICS Category Descriptions

Motor Vehicles & Parts: Establishments that sell new & used autos, boats, motorcycles, golf carts, RV's, campers, trailers, tires, and parts.

Furniture: Stores that sell furniture, beds, carpeting, window coverings, lamps, china, kitchenware, & woodburning stoves.

Electronics: Establishments primarily engaged in retailing household-type appliances, sewing machines, cameras, computers, and other electronic goods.

Building Materials: Establishments that sell lumber, hardware, paint, wallpaper, tile, hardwood floors, roofing, fencing, ceiling fans, lawn equipment, and garden centers.

Food: Grocery stores, deli's, bakery, & butcher shops that sell food to be prepared at home. Liquor stores.

Health & Personal: Pharmacies, food supplements, vision supplies, cosmetics, & hearing aid stores.

Gas and Convenience Store: Retailers that sell fuel along with convenience store items.

Apparel: New clothing and accessories, jewelry, shoes, bridal shops, clock shops, and luggage stores.

Leisure Goods: Sporting goods, books, music, hobby stores, fabric shops, and toy stores.

*Caution should be used when comparing pull factors before 2003 to those in later years due to the switch from SIC to NAICS.

Recent Trends By Merchandise Category

Winona County

The following tables and charts depict pull factors in Winona County from 2003 to 2013* by merchandise category. Pull factors are a measure of trade area size that provide a useful measure of changes over time because they account for changes in population and state-wide industry trends.

Pull Factors by NAICS Merchandise Category (2 of 2)

NAICS Category Descriptions

General Merchandise: Establishments that sell a mixed line of goods. Examples are department stores, supercenters, and dollar stores.

Miscellaneous Store Retailers: Stores not covered in other categories such as florists, office supplies, pets, antiques, tobacco, art, used merchandise, and trophies.

Non-Store Retail: Retailers that do not use stores. This includes mail order, internet selling, bazaars, vending machines, fuel oil dealers, firewood dealers, door-to-door sales, and produce stands.

Amusement: Establishments such as golf courses, bowling lanes, marinas, amusement parks, water parks, shooting ranges, pool halls, horseback riding, ballrooms, health club facilities, ski hills, and casinos.

Lodging: Seasonal resorts, hotels, boarding houses, bed & breakfast, campgrounds, and RV parks.

Eating & Drinking: Restaurants, donut shops, coffee house, cafeteria, caterers, taverns, and nightclubs.

Repair: Businesses that return equipment to working order. Examples: cars, lawnmowers, small engines, knives, shoes, computers, furniture, and appliances.

Personal Services: Barbers, beauty salons, tanning facilities, funeral homes, laundromats, dry cleaners, pet groomers, and kennels.

*Caution should be used when comparing pull factors before 2003 to those in later years due to the switch from SIC to NAICS.

Trade Area Analysis of Retail Sales

Winona County

The following tables provide information on retail sales by merchandise category. "Potential sales" is a standard to which actual performance is compared. In calculating potential sales, population and income characteristics are taken into account. Potential sales can be used as a guideline or "par value" in analyzing retail strength.

Deviations from these norms can be analyzed to first judge whether they should be considered relevant. If the differences appear to be significant (whether in dollar amounts or relatively with percentages), additional consideration is merited. Categories with undesirable performance may be further examined for potential corrective action. It is also important to determine whether or not the situation is relatively uncontrollable due to external or extenuating circumstances. In cases of favorable differences from expectations, the positive aspects should be identified and built upon.

Winona County Retail Trade Performance in Percentages

The chart below depicts the percentage amount Winona County's actual sales were above or below potential sales in 2013 by merchandise group. Of the 16 merchandise categories with reported data, sales in 5 of the categories were above what would be expected based on the county's population and income characteristics as well as statewide spending patterns. The strongest merchandise group by this standard is the General Merchandise Stores category, which has a 90.7 percent surplus. Overall, Winona County had a retail sales surplus of 0.1 percent.

It is important to note that variations in a county's relative retail performance may occur for a variety of reasons, some of which are beyond the control of local policy. Proximity to larger population centers and transportation patterns, as well as the individual retailer's management and marketing, can cause the retail sales of a particular county to deviate substantially from potential sales. It is important that decision-makers consider these influences when constructing policies, plans, or projects.

Percentage Above or Below Potential Sales, 2013

Winona County Retail Trade Performance in Dollars

The chart below depicts the dollar amount Winona County's actual sales were above or below potential sales in 2013 by merchandise group. Of the 16 merchandise categories with reported data, sales in 5 of the categories were above the calculated potential. The strongest merchandise group by this standard is the General Merchandise Stores category, which has a \$36.3 million surplus. Overall, Winona County had a retail sales surplus of \$0.5 million in 2013.

It is important to note that variations in a county's relative retail performance may occur for a variety of reasons, some of which are beyond the control of local policy. Proximity to larger population centers, management, marketing, and transportation patterns are just a few factors that can cause the retail sales of a particular county to deviate substantially from potential sales. It is important that decision-makers consider these influences when constructing policies, plans, or projects.

State of Minnesota Per Capita Taxable Retail Sales & Threshold Levels for Selected Goods and Services 2013

Threshold level refers to the number of people per business, which can be used as a general guide for determining the "critical mass" necessary to support a business. These are broad averages for the state as a whole and do not reflect differences in income, tourism, agglomeration, establishment, etc. Further, the business counts are based on the number of sales tax returns filed and are converted to "full-time equivalents." Multiplying people per business by sales per capita yields average sales per firm. In addition to state averages, averages for the non-metropolitan regions were calculated by excluding the seven county Minneapolis-St. Paul metropolitan region.

Business Activity / Store Type NAICS	People Per Business		Sales Per Capita		
	State	Non-Metro	State	Non-Metro	Winona
RETAIL TRADE					
441 Vehicles, Parts	1,970	1,421	\$447.06	\$448.88	\$371.24

Compare the Community to the Region

Winona and Winona County

On other pages of this report we compared communities using a combination of retail sectors and service sectors. The information on this page only includes businesses in **retail trade** and does not include service sectors. The retail trade sectors include the following: building materials, motor vehicles & parts, clothing, food stores, electronics, convenience stores, leisure goods, health stores, furniture, general merchandise, non-store retail, and miscellaneous stores.

Data Sources and Definitions

The University of Minnesota Extension has developed this retail trade analysis program to assist in the economic development of Minnesota towns and cities. These reports are available for all Minnesota counties, for most cities above 5,000 populations and for a few cities smaller than 5,000 population. The retail sector of each jurisdiction can be evaluated by comparing its trends to those of other similar jurisdictions. Business people and economic development officials can use measures such as pull factors and leakages to determine the need and feasibility of new retail businesses.

DATA SOURCES

Most of the data in the analysis are based on annual reports of Minnesota retail and use tax, published by the Minnesota Department of Revenue. The Department of Revenue published an annual report of sales and use tax by jurisdiction until 1996, at which time the reports were released biannually due to budget constraints. This analysis uses the available reports from 1990-1996, 1998, 2000, and 2003 through 2013. The reports interpolate data for the years in which data are not available. See http://www.revenue.state.mn.us/research_stats/Pages/Sales-and-Use-Tax-Statistics-and-Annual-Reports.aspx . The income data in this report are obtained from reports by Bureau of Economic Analysis (BEA). (See http://www.bea.gov/iTable/index_regional.cfm) Population data after 2009 are derived from the state demographic center. (See <http://mn.gov/admin/demography/data-by-topic/population-data/our-estimates/index.jsp>)

Sales and use tax permit holders file returns and remit taxes on a monthly, quarterly or annual basis. Large businesses such as discount department stores whose tax is more than \$500 per month are required to file on a monthly basis, while medium-sized businesses whose sales tax collections are less than \$500 per month, are required to file on a quarterly basis and small businesses with sales tax collections less than \$100 per month would most likely file on an annual basis.

DEFINITION OF TERMS

Gross Sales

Gross sales include taxable sales and exempt sales for businesses holding sales and use tax permits. This is the most inclusive indicator of business activity for the reporting jurisdictions but it can be misleading when used in comparisons. At times commodity items (like gasoline) that are not taxable can have large price variations, creating huge swings in gross sales.

Taxable Sales

Taxable sales are the amount of sales subject to sales tax. Taxable sales exclude exempt items, items sold for resale, items sold for exempt purposes and items sold to exempt organizations. For more information on what is taxed in Minnesota, see "Minnesota Sales and Use Tax Instruction Booklet" available on the web at

http://www.revenue.state.mn.us/Forms_and_Instructions/sales_tax_booklet.pdf.

Current and Constant Dollar Sales

Current dollar (or "nominal dollar") sales are sales as reported by the state. No adjustment has been made for price inflation. In general this measure of sales is not satisfactory for comparisons over long periods of time since it does not account for changes in population, inflation, or the state's economy. Constant dollar (or "real dollar") sales reflect changes in price inflation by adjusting current dollar sales with the Consumer Price Index (CPI). Constant dollar sales indicate the real sales level with respect to a base year. This is a more realistic method of evaluating sales over time than current dollar comparisons, but still does not take into consideration changes in population or changes in the state's economy.

Number of Businesses

The number of sales and use tax permit holders who filed one or more tax returns for the year are reported as the number of businesses.

Reporting Period

The reporting periods though 2005 in this report are calendar years. For example, the sales reported for the year 2000 are for the period, January 1, 2000 to December 31, 2000. The Sales and Use Tax Statistics reports for 2006 and 2007 use a slightly different methodology than in previous years. Rather than basing the report on the year in which sales were made (as was true in earlier reports), the 2006 and 2007 reports were based on when returns were processed. Starting in 2008, the reports are again based on the calendar year when the sales occurred.

Per Capita Sales

Per capita (or "per person") sales are calculated by dividing current dollar sales by the population estimate. In areas where population is subject to substantial change, this is a more satisfactory measure of sales activity than sales alone. However, it still does not reflect changes in the state economy.

Number of Businesses

The number of sales and use tax permit holders who filed one or more tax returns for the year are reported as the number of businesses.

Pull Factor

The pull factor was developed by Dr. Ken Stone, an economist from Iowa State University Extension Service, to provide a precise measure of sales activity in a locality. It is derived by dividing the per capita current dollar sales of a city or county by the per capita sales for the state. For example, if a city's per capita sales are \$20,000 per year and the state per capita sales are \$10,000 per year, the pull factor is 2.0 ($\$20,000 \div \$10,000$). The interpretation is that the city is selling to 200 percent of the city population. Worth noting that local consumption patterns or local average prices may skew pull factors. As example, a city may not have enough people willing to buy \$35 steak dinners to support restaurants that typically carry expensive selections.

Pull factors are good measures of sales activity because they reflect changes in population, inflation, and the state economy. Pull factors are available through the University of Minnesota Extension for total taxable sales for all cities with reported sales (generally, cities with a population of 5,000 or more) since 1990. The pull factors listed in this report are not adjusted for differing income levels in different communities; they are simply the ratio of local per person sales to the state average. Income levels are accounted for in the expected sales and potential sales formulas, described below.

Typical Pull Factor

The typical pull factor is a pull factor that represents the “norm” for cities within a population group. It is an average for cities within a population group excluding some of the outliers in the group.

Personal Income

Personal income is defined as the income received by, or on behalf of, all the residents of the county (state) from all sources. Personal income is the estimated sum of wage and salary earnings, supplements to wages and salaries (e.g. contributions to retirement funds, health plans, life insurance policies), proprietors' income, rental income, personal dividend income, personal interest income, and personal current transfer receipts to persons (e.g. receipts of Social Security, disability, worker's compensation, Medicare/Medicaid, food stamps, etc.) less contributions for government social insurance (e.g. Social Security, Medicare).

Index of Income

This index provides a measure of income, relative to the state, which is calculated by dividing local per capita income by state per capita income. The base is 1.00. For example, an index of income of 1.20 indicates that per capita income in the area is 20 percent above the state average.

Expected Sales

Expected sales are a retail performance benchmark. It is an estimate of the sales level a city would achieve if it were performing on par with Minnesota cities of a similar size. In addition to population and income variables, expected sales incorporate the typical strength of comparable communities via the typical pull factor. Expected sales are the product of city population, state per capita sales, the index of income and the typical pull factor. For example, if a city has a population of 5,000, the state per capita sales are \$9,000, the typical pull factor is 1.30, and the index of income is 1.03, expected sales are approximately \$60 million per year ($5,000 \times \$9,000 \times 1.30 \times 1.03$). This provides a means of comparing what is expected for a city of a certain size to what is actually happening.

Potential Sales

Potential sales are an estimate of the amount of money that is spent on retail goods and services by residents of a county. It is the product of county population, state per capita sales and the index of income. The potential sales concept for counties is similar to the expected sales calculations for cities. However, potential sales do not utilize a measure of average pulling power (like the typical pull factor that is used in the expected sales equation). Since a county is a relatively large region within which retail business takes place, counties are compared without adjustments for trade area size.

Variance between Actual and Expected Sales (Surplus or Leakage)

The variance between actual and expected sales is how much retail sales differ from the “norm” (i.e., the amount above or below the standard established by the expected sales formula). When actual sales exceed expected sales, we say the city has a "surplus" of retail sales. When actual sales fall short of expected sales, we say the city has a retail sales "leakage". The set of similarly-sized cities in Minnesota is the peer group to which the comparison is being made. Discrepancies between expected and actual sales occur for a variety of reasons.

Trade Area Population Gain or Loss

The trade area population gain or loss translates the percentage amount of surplus or leakage of retail sales into an estimate of the number of customers gained or lost in the trade area. It is calculated by multiplying the percent surplus or leakage by the population estimate for the city or county. For example, if a city with 10,000 residents had a retail sales surplus of 20%, the trade area population gain would be 2,000. Adding this number to the city's population gives an estimate of the population size of the city's trade area.

Calculating Expected Sales Using Comparisons with Other Rural Cities

Beginning in the middle of 2013, Retail Trade Analysis reports for cities outside of the 7-county Twin Cities area contained new Rural Community Trade Area Analysis pages. The earlier paragraph of how Expected Sales are calculated explained that a typical pull factor of similar-sized cities was used in the formula. These new pages for rural communities only use similar cities that meet the following three criteria: 1) within approximately 30% of similar population; 2) located outside of the 7-county metro area; 3) have a similar location on the trade-center hierarchy scale. Cities with a similar trade center hierarchy have a history of similar total taxable retail and service sales. This method will keep the pull factors from metro cities like Mendota Heights and Little Canada being used in calculations for rural cities like Fairmont and Grand Rapids. More information on trade center hierarchy can be found in the article *Trade-Center Hierarchy in Greater Minnesota* authored by Craig and Schwartau at <http://www.cura.umn.edu/publications/catalog/reporter-41-3-4-2>. This article noted there was little relative movement in any one city's hierarchy ranking with just a few exceptions where dramatic economic changes occurred.

CAUTIONS

Gross Sales

Gross sales are a comprehensive measure of business activity, but readers should be aware that the numbers in this report are self-reported by holders of sales and use tax reports. Furthermore, the gross sales are not audited by the State of Minnesota. It is believed that the gross sales figures are generally reliable, but there is the possibility of distortions, especially in smaller cities where misreporting may have occurred.

Misclassification

Holders of sales and use tax permits select the North American Industry Classification System (NAICS) category that best fits their business. Regardless of who makes this classification, errors are occasionally made. Also, sometimes a business will start out as one type of business, but may evolve over time to a considerably different type of business. Misclassifications can distort sales among business categories, especially in smaller cities. For example, a furniture store that is classified as a general merchandise store, will under-report the sales in the furniture store category and over-report the sales in the general merchandise category.

Suppressed Data

The sales data for merchandise categories that have less than four reporting firms are not reported. This is a measure taken by most states to protect the confidentiality of sales tax permit holders. The sales for suppressed retail categories are placed into the miscellaneous category and are included in total sales. The sales for suppressed service categories are placed into the NAICS 999 category and are not included in total sales.

Consolidated Reporting

Vendors doing business at more than one location in Minnesota have the option of filing a separate return for each location or filing one consolidated return for all locations. The consolidated return shows, for each business establishment, the sales made, tax due and location by city and county. Data for the establishments of consolidated filers are combined with data for single-location filers to produce the figures in this report. Occasionally consolidated reports may not be properly deconstructed and all the sales for a company may be reported for one city. Whenever misreporting is discovered, contacts are made by the Minnesota Revenue Department to clarify the situation.

Changes between 2000 and 2003

For fiscal year 2003, the Minnesota Department of Revenue implemented two major changes to improve their reporting of sales and use tax data. First, they adopted a geo-coding system, which accurately identifies the location of all business reporting sales and use tax to the state rather than relying on the businesses' postal addresses. One effect of this change is a movement of sales between neighboring cities (and in some cases, counties) in the year 2003. Thus, in several of the suburbs of Minneapolis and St. Paul and in cities such as Hermantown, which is adjacent to Duluth, the data show large increases in retail sales between 2000 and 2003, a substantial portion of which is due to the re-coding of business location and not to actual growth in sales.

The second change implemented by the Department of Revenue in 2003 was a shift from the Standard Industrial Classification system (SIC codes) to the 2002 North American Industry Classification System (NAICS codes). This switch does affect the comparability of the data series prior to 2000 with that of 2003 (and beyond), especially for merchandise categories. Overall retail and services sales are highly comparable over time. In many cases, the merchandise categories for the data prior to 2003 are very closely related to the new categories. For example, approximately 97% of the 2003 statewide sales in the general merchandise category were accounted for by firms also classified as general merchandise under the SIC system. In other cases, the correspondence is less straightforward. For example, only 56% of 2003 statewide sales in the Food and Beverage store category were accounted for by firms classified as Food Stores under the older classification system; 41% of 2003 Food store sales were accounted for by firms previously categorized as Miscellaneous Retail.

The 2002 NAICS system does provide greater detail and introduces some new sectors, such as Retail Electronics. Over time, these changes will improve the information available for retail trade analysis.

Pull Factor Changes in 2013 Data

The calculation for pull factor, as described on Definitions page 2, uses the divisor "state sales per capita." Prior to 2013, the state taxable sales amount was obtained from the Minnesota Department of Revenue "Statewide by 3-Digit Industrial Code" sales tax report. However, certain retail and service categories have a large portion of their sales occurring from businesses outside of Minnesota. These include non-store retailers and the information service NAICS categories (telecommunications, publications, and broadcasting). Beginning with the 2013 data, the Minnesota sales from out-of-state businesses are no longer included in the calculation for the pull factor. While the individual retail and service sector pull factors in this report are not greatly affected by this change (except for non-store retail), the overall pull factor for the city may be increased by 8 to 14% depending on the amount of internet, mail order, and phone sales each year.
